

This is the
Undercarriage Member
of unique design
in the

FLIGHT PHOTOGRAPH

WESTLAND 'LYSANDER'

This unusual member, fabricated from a hollow extrusion in *HIDUMINIUM R.R.56, is the backbone of the machine, sustaining weight on the ground and lift in the air. It possesses low weight and permits efficient streamlining, thus contributing greatly to the machine's fine performance.

It is but one of many triumphs for HIDUMINIUM in this machine, where close co-operation from drawing board to production has ensured one of the most outstanding aeroplanes for many years.

The experience of our Engineers and Research Laboratories is available to you for similar co-operation.

HIDUMINIUM

*NO METAL THAT IS LIGHTER, IS AS STRONG;
 NONE THAT IS STRONGER, IS AS LIGHT
